Evaluation of a novel concept for safe sharing of a tibial fixation device. Although the process of percutaneous distal locking of the tibia using a tibial external fixator has become a standard of care in the management of many long bone fractures, concerns about the safety and efficacy of this procedure continue. To

address these concerns, we designed and evaluated a new cutting tool for distal locking of tibial fixators. The tibial cutting tool has a safety mechanism that prevents an accidental application of excessive force on the cutters that may cause fracture of the anterior cortex. A blinded, randomized clinical trial was performed to determine whether a tibial cut using the novel tibial cutting tool (Neo-

Lock™) differs from standard percutaneous distal tibia locking (PTL) techniques. In the PTL group, a 9.5-mm locking screw was inserted with a 1-mm safety margin and 0.5-mm countersink. In the Neo-Lock group, the tibial cut was made first, followed by the application of a tibial distraction screw (Neo-Lock Distraction Screw, Synthes) over the cutting tool with 0.5 mm of safety margin. Postoperatively,

data on adverse events, precision of the cut, accuracy of the cut, and fracture rate (identified at 1 and 2 years) were compared between the groups. There were no significant differences in adverse events or accuracy of the cut between the 2 groups. The distance between the cutting tool and the anterior cortex was 10.1 ± 0.3 mm in the PTL group and 11.1 ± 0.5 mm in the Neo-Lock group (P = 0.003).

The tibial cut using the cutting tool was accurate in 98% of the overall cut, 99% of the proximal cuts, and 100% of the distal cuts. None of the tibiae in either group fractured. The novel tibial cutting tool demonstrated a significant difference in the distance between the anterior cortex and the cutters. The device has a rigid safety mechanism to prevent inadvertent application of excessive force on the cutters,

which may cause fracture of the anterior cortex. UNPUBLISHED UNITED STATES COURT OF APPE

. For the purposes of optimizing X-Y offsetting, color space sample conversion, and other transformations, a gamma space is a linear space while a color space is a non-linear space. For the purposes of rendering,

rendering engines and the graphic cards they run on operate in linear space. The common rendering parameters in computer graphics are gamma corrected, which means that all color values are multiplied by a "correct" gamma value. Ixodidae) from the Pacific coast. This study represents the first report of Rickettsia from ticks in Chile. A total of 7,907 ticks belonging to the genera Amblyomma, Dermacentor, Haemaphysalis, Hyalomma, Ixodes, Ornithodoros, Rhipicephalus, and the subgenus Ornithodoros were collected, primarily on livestock, from a rural region of the central-eastern coast of Chile. In this first

assay, 7,061 ticks were examined for the presence of Rickettsia using immunofluorescence assay (IFA) on monolayers of bovine alveolar macrophages (BAM), in which the diverse Rickettsia strains were culture-adapted and grown up to 37 days, using polyclonal antibodies produced against Rickettsia rickettsii, Rickettsia conorii, Rickettsia australis, Rickettsia akari, Rickettsia felis,

and Rickettsia buchneri, species or subspecies closely related to the Chilean strains. The rates of isolation of Rickettsia spp. from ticks on the Pacific coast were the following: Ornithodoros rahmati (71.8%), Hyalomma marginatum (52.8%), Dermacentor marginatus (33.2%), Amblyomma neumanni (9.2%), Rhipicephalus sanguineus (3.6%), Hyalomma excavatum (1.9%), and

Amblyomma cajennense (1.5%).
All of these Rickettsia strains are
closely related to strains of
Rickettsia rickettsii, Rickettsia
australis, Rickettsia sibirica,
Rickettsia felis, Rickettsia akari,
