Use the arrow keys to scroll down in a large. when opened in WindowsÂ .Q: How to create a site.js file in react project Is there a way to create a site.js file in a react project? I need this file to be a place to define my global middleware. Right now I have to put the code into App.js file. import './utils/site.js'; export default class App extends React.Component { ... } I did a little research and found that the'site.js' file should be located in /public directory. My question is whether or not this is a good practice. Or is there something that I don't know? I am new to react. A: Nope, this is not a good practice. Site.js is a convention for writing global middleware, but in a way that it is specific to your express server stack of choice. It's not a convention for what JS/NPM should use as default to load global middleware. For good measure, this would cause a lot of confusion to someone coming from a different server stack. Instead I'd recommend you use a library like create-react c6a93da74d
